### **DETAILED ACTION**

#### Notices & Remarks

1. Claims 1-20 are pending for the examination.

## Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 3. Claims 1-2, 6-10, 14-18 and 20 are rejected under 35 U.S.C. 102(e) as being anticipated by Clark et al. (U.S. Pat. No. 6,233,634 B1).

As to claim 9, Clark teaches a managed server (fig. 1 server 10), comprising:

a video controller (video controller 20) that is operatively connected to a communication bus (expansion bus); and

a remote server management controller (server controller 26) that is connected to the communication bus and adapted to snoop data that is intended for the video controller from the communication bus (col. 8 lines 36-55), the remote server management controller comprising:

a FIFO (fig. 5 local frame buffer 48) that is adapted to store data snooped from the communication bus (col. 9 lines 46-50); and

an embedded bus master (detection logic 30) that is operatively connected to the communication bus, the embedded bus master being adapted to take control of the

Application/Control Number: 10/037,502

Art Unit: 2182

communication bus responsive to a signal that the FIFO has become filled to a predetermined level to prevent the FIFO from being overflowed with snooped data while snooped data stored in the FIFO continues to be processed (col. 9 line 44 to col. 11 line18).

As to claims 10 and 2, Clark teaches a passive throttling register that stores a value (col. 7 lines 37-48); and wherein the embedded bus master takes control of the communication bus by reading the value and preventing communication on the communication bus for a time period that corresponds to the value (col. 9 line 44 to col. 11 line18).

As to claims 14 and 6, Clark teaches the value is stored in the passive throttling register when the remote server management controller is initialized (col. 10 lines 27-43).

As to claims 15 and 7, Clark teaches the value is updated periodically (col. 22 line 46 to col. 23 line 14).

As to claims 16 and 8, Clark teaches the value is proportional to a volume of traffic on the communication bus (col. 22 line 63 to col. 23 line 14).

As to claim 1, Clark teaches a remote management controller (fig. 1 server controller 26) that snoops data from a communication bus (expansion bus col. 8 lines 36-55) comprising:

a FIFO (fig. 5 local frame buffer 48) that is adapted to store data snooped from the communication bus (col. 9 lines 46-50); and

Art Unit: 2182

an embedded bus master (detection logic 30) that is operatively connected to the communication bus, the embedded bus master being adapted to take control of the communication bus responsive to a signal that the FIFO has become filled to a predetermined level to prevent the FIFO from being overflowed with snooped data while snooped data stored in the FIFO continues to be processed (col. 9 line 44 to col. 11 line 18).

As to claim 17, Clark teaches a method of passively throttling a communication bus (fig. 4 EISA bus), comprising the acts of:

snoop a communication bus (col. 8 lines 36-55);

storing data snooped from the communication bus in a storage device (col. 9 lines 46-50); determining if the storage device is filled to a predetermined level (col. 9 line 44 to col. 11 line 18);

preventing further transfers of data on the communication bus responsive to the act of determining of the storage device is filled to a predetermined level (col. 9 line 44 to col. 11 line 18).

As to claim 18, Clark teaches the method of claim 17, further comprising the acts of: storing a value in a register (col. 7 lines 37-48);

reading the value (col. 9 lines 27-43); and

wherein the act of preventing further transfers of the specific type of data is performed for a time period that corresponds to the value (col. 9 line 44 to col. 11 line18).

As to claim 20, Clark teaches the method of claim 17, wherein the recited acts are performed in the recited order (col. 8 lines 1-26).

### Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 11-13, 3-5 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Clark in view of Brown (U.S. Pat. No. 6,728,808 B1).

As to claims 11-12 and 3-4, Clark fails to explicitly teach a PCI bus and a number of PCI clock cycles. Brown; however, teaches the communication bus is the PCI bus and the values is the number of PCI clock cycles (col. 7 lines 24-34). It would have been obvious to a person of ordinary skill in the art to have the PCI bus in order to provide a high speed and low latency bus architecture (col. 1 lines 57-59).

As to claims 13, 5 and 19, Clark teaches the embedded bus master is adapted to take control of the communication bus by initiating an EISA read transaction on the passive throttling register (col. 9 line 44 to col. 11 line18). Clark fails to explicitly teach a PCI bus. Brown; however, teaches the PCI bus (col. 7 lines 24-34). It would have been obvious to a person of ordinary skill in the art to have the PCI bus in order to provide a high speed and low latency bus architecture (col. 1 lines 57-59).

### Conclusion

6. The prior art made of record and not relied upon is considered pertinent to

applicant's disclosure.

U.S. Pat. No. 6,851,008 B2 (Hao)

7. Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Mike Nguyen whose telephone number is 571 272-4153. The

examiner can normally be reached on 8:00AM-4:30PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Jeffrey Gaffin can be reached on 571 272-4146. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
